

Golden Dawn Daffodil

Description: Daffodil with creamy yellow petals and yellow-orange coronas blooms from late winter to early spring. About 2 feet in height. Will reproduce rapidly by offsets.

Daffodils, or narcissus, are a bright and vibrant spring flower that trumpet into any garden. They are known for being easy, reliable and great for beginner gardeners. Daffodil bulbs can be planted in various soil conditions as well as sun or part shade.

How Long Do Daffodils Bloom?

Daffodil blooms can last up to three weeks when temperatures remain between 45 and 55 degrees Fahrenheit. However, when temperatures rise above 65 degrees Fahrenheit, blooms can only last for a few days.

Like most **bulbs planted in the fall**, Daffodils will bloom from early to late spring, depending on the weather conditions. Daffodils perform well within hardiness zones 3 to 9. Once blooming is over for spring, allow the leaves to remain on the plant for about six weeks. This period will allow the bulb to absorb nutrients and grow for the following year.
