

Orange Spiral Ginger

Gingers are a diverse and beautiful group of plants frequently used in Florida landscapes. They're typically low-maintenance plants with attractive foliage and long-lasting, colorful blooms that make great cut flowers.

These perennials reproduce through underground stems (rhizomes) and perform best in rich, moist soil although they are quite drought tolerant. Spiral gingers do well in part-sun, filtered sun, or shade. Cold winters in North and Central Florida will cause them to go dormant in the winter, but they return with the warm weather.

Easy to grow cold hardy hummingbird attractor Orange Indianhead Ginger Rhizome

Cold hearty to zone 8

Filtered to full sun. The shyest of the gingers in my yard, it appears in May/June and grows to 8 feet with long-lasting orange on orange flowers at the top of the plant.
